

```

public class ClassA {
    private static int i;
    private int j;
    public classA() {
        i = 2;
        j = 1;
    }
    public void m(int a) {
        i = a;
        j = a;
    }
}

```

```

}
public static void main (String[] args) {
    ClassA c = new ClassA();
    c.m(3);
    ClassA b = new ClassA();
    b.m(5);
}

```

There is 1 static object of each class

Static objects are created by Java, not by the programmer.
