### Wu's Characteristic Set Method

**Input:**  $F \subset \mathbf{k}[x_1, \dots, x_n]$  and a variable ordering  $\leq$ . **Output:** *C* a Wu characteristic set of *F*.

```
repeat

(S) B := MinimalAutoreducedSubset(F, \leq)

(R) A := F \setminus B;

R := prem (A, B)

(U) R := R \setminus \{0\}; F := F \cup R

until R = \emptyset

return B
```

• Repeated calls decomposes V(F) into quasi-components.

# Buchberger's Algorithm

**Input:**  $F \subset \mathbf{k}[x_1, \ldots, x_n]$  and a term order  $\leq$ . **Output:** G a reduced Gröbner basis w.r.t.  $\leq$  of the ideal  $\langle F \rangle$ generated by F. repeat (S)  $B := MinimalAutoreducedSubset(F, \leq)$ (R)  $A := \mathbf{S}_{-}\mathbf{Polynomials}(B) \cup F$ ; R :=**Reduce**  $(A, B, \leq)$ (U)  $R := R \setminus \{0\}; F := F \cup R$ until  $R = \emptyset$ return B

Let T ⊂ k[x<sub>1</sub> < · · · < x<sub>n</sub>] \ k be a triangular set, hence the polynomials of T have pairwise distinct main variables.

  - init(P) and init(Q) are regular modulo sat(T),
  - Let  $1 \le d \le \deg(Q, y)$  such that  $S_j \in \operatorname{sat}(T)$  for all  $0 \le j < d$ .
  - $lc(S_d, y)$  is regular modulo sat(T),

Theorem (Xin Li, M.M.M., Wei Pan 2009)

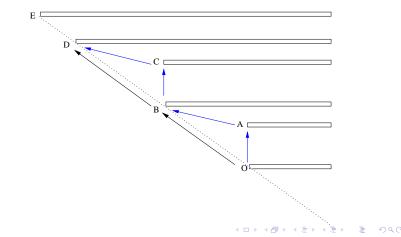

Assume that one of the following conditions holds:

- $\blacktriangleright$  sat(*T*) is radical,
- ▶ for all  $d < k \le mdeg(Q)$ , the coefficient of  $y^k$  in  $S_k$  is either null or regular modulo sat(T).

Then,  $S_d$  is a regular GCD of P, Q modulo  $\operatorname{sat}(T)$ .

## Computing Regular GCDs: Bottom-up!

- ► Assume that the subresultants S<sub>j</sub> for 1 ≤ j < mdeg(Q) are computed.</p>
- ► Then one can compute a regular GCD of P, Q modulo sat(T) by performing a bottom-up search.

## Generic Bivariate Systems

- "our code" means BivariateModularTriangularize in MAPLE 13.
- Random generic input systems, thus equiprojectable.
- For the largest examples (having about 5700 solutions), the ratio is about 460/7 in our favor.

## Non-generic Bivariate Systems

- Examples designed to enforce many "splittings" (many equiprojectable components).
- ▶ For the largest examples, the ratio is 5260/80, in our favor.

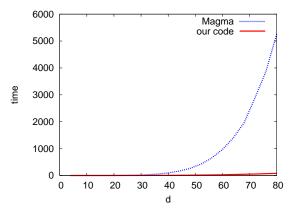

Figure: Non-generic bivariate systems: MAGMA vs. us.

#### Generic Trivariate Systems

► MAPLE means the experimental and fast version of Triangularize to be integrated in MAPLE 14.

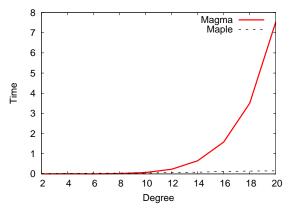

Figure: Generic dense 3-variable.

## Do Triangular Decompositions Have the Rigth Size?

▲□> <圖> < ≧> < ≧> < ≧</p>

## Do Triangular Decompositions Have the Rigth Size?

- ▶ Let  $T \subset \mathbf{k}[x_1, \ldots, x_n]$  be a 0-dimensional reg. chain with all  $\operatorname{init}(T_i) = 1$ . There exists a 0-dimensional reg. chain N such that V(T) = V(N) and the height (or "size") of each coefficient in N is upper bounded by
  - ► the height of V(T), that is, the minimum size of a data set encoding V(T), if k = Q,
  - the degree of V(T<sup>↓</sup>), if k is a field 𝔽<sub>p</sub>(t<sub>1</sub>,..., t<sub>m</sub>) of rational functions and T<sup>↓</sup> is T regarded in k[t<sub>1</sub>,..., t<sub>m</sub>, x<sub>1</sub>,..., x<sub>n</sub>].

See (X. Dahan, É. Schost 04) for precise statements.

## Do Triangular Decompositions Have the Rigth Size?

- ▶ Let  $T \subset \mathbf{k}[x_1, \ldots, x_n]$  be a 0-dimensional reg. chain with all  $\operatorname{init}(T_i) = 1$ . There exists a 0-dimensional reg. chain N such that V(T) = V(N) and the height (or "size") of each coefficient in N is upper bounded by
  - ► the height of V(T), that is, the minimum size of a data set encoding V(T), if k = Q,
  - the degree of V(T<sup>↓</sup>), if k is a field 𝔽<sub>p</sub>(t<sub>1</sub>,..., t<sub>m</sub>) of rational functions and T<sup>↓</sup> is T regarded in k[t<sub>1</sub>,..., t<sub>m</sub>, x<sub>1</sub>,..., x<sub>n</sub>].

See (X. Dahan, É. Schost 04) for precise statements.

Let I ⊂ k[x<sub>1</sub> < x<sub>2</sub>] be 0-dimensional radical with degree d and h be the height of V(I). There exists a (non-reduced) lexicographical Gröbner basis G of I such that the height of a coefficient is essentially quadratic in both h and d. These estimatas are sharp. Estimates become cubic for the reduced basis. (X. Dahan 09).

# What Plays the Role of Degree Bases for Triangular Decompositions ?

# What Plays the Role of Degree Bases for Triangular Decompositions ?

- ► In my opinionm Triangular Decompositions themselves do:
  - Even if degree bases instead of lex bases are used in the previous benchmarks, the bivariate and triavariate Triangularize solvers remain faster.
  - Keep in mind that a triangular decomposition is "essentially" a factored lex basis (D. Lazard 92)
  - For Generic input system  $\mathbb{F}_p[x_1, \ldots, x_n]$  in degree d = 2,
    - n=3 the output of Triangularize vs that of Basis gies 7200 vs 13400 characters long
    - n = 4 the output of Triangularize vs that of Basis gies 23000 vs 1005000.

# What Plays the Role of Degree Bases for Triangular Decompositions ?

► In my opinionm Triangular Decompositions themselves do:

- Even if degree bases instead of lex bases are used in the previous benchmarks, the bivariate and triavariate Triangularize solvers remain faster.
- Keep in mind that a triangular decomposition is "essentially" a factored lex basis (D. Lazard 92)
- For Generic input system  $\mathbb{F}_p[x_1, \ldots, x_n]$  in degree d = 2,
  - $n=3\,$  the output of Triangularize vs that of Basis gies 7200 vs 13400 characters long
  - n = 4 the output of Triangularize vs that of Basis gies 23000 vs 1005000.

Size estimates are promising but not enough. More on this another time.

# Which Types of Polynomial Systems for Which Method?

 Incremental Methods are probably best for square systems, regular sequences and probably bad for overconstrained systems.

# Which Types of Polynomial Systems for Which Method?

- Incremental Methods are probably best for square systems, regular sequences and probably bad for overconstrained systems.
- For overconstrained systems one may conider restarting from the elimnation methods (Wen-Tsün Wu, Dongming Wang, Kalkbrener, ...) making use of modular methods, fast arithmetic, multivariate resultants, etc.
