1) What is the coupling effect and how does it relate to software testing?

2) In the article by Demillo, Lipton, and Sayward ‘‘Hints on Test Data Selection: Help for the Practicing Programmer’’, what is the recommendation made to the practicing programmer?

3) What are management reviews, technical reviews, and inspections in general, and in particular, what are their key differences?
4) Attached find the code and documentation for the Unix cut program. This material forms the basis for explorations in: dealing with legacy code, exploratory testing, and code review. The issue of establishing appropriate pre and post conditions for the routines of this code as well as loop invariants for the loops also arises. Starting just from the documentation, one could also consider how one would develop an implementation using Behavior-driven and Test-driven development. Illustrate.
